

Working Together

to Keep Bees In the Field and Pests Out!

Farmers depend on pollinators to help many of their crops grow and bear fruit and seeds. They also depend on pest control technology to protect those crops from the damaging effects of pests and disease. By promoting collaboration among beekeepers and farmers at the local level, we can all help make sure that crops grow strong, bee populations thrive, and plant threats stay out!

CropLife America, the voice of the crop protection industry, promotes sound stewardship practices for the use of crop protection products. The industry works with growers, beekeepers, regulators, and other stakeholders to support bee health through a variety of ways, including through the educational website www.AmericasHeartland.com. For more information on increasing local collaboration among farmers and beekeepers, visit www.CropLifeAmerica.org.
